PROCESS BOOK

Health Connect

Team 1

BrookeLynn Acevedo, Davis Germain, Alice Kang, Peter Shpelfogel, Ava Shu, Katie Weng

BRAINSTORMING

1. Autonomous Goal Execution (Brooke)
- Takes high-level objectives and independently plans, acts, and completes them end-to-end.

2. Adaptive Planning & Replanning (Ava)
- Builds step-by-step strategies and continuously adjusts them as conditions change.

3. Structured Reasoning & Decomposition (Katie)
- Breaks complex problems into smaller parts and works through them systematically.

4. Tool & Environment Interaction (Davis)
- Uses external tools, software, APIs, and environments to take real-world or digital actions.

5. Memory & Context Awareness (Katie)
- Maintains and applies short- and long-term context to improve relevance and continuity.

6. Self-Improvement Loop (Davis)
- Evaluates outputs, learns from feedback, and iterates to improve performance over time.

7. Collaboration & Multi-Agent Coordination (Brooke)
- Works with humans or other agents, sharing tasks and aligning toward shared goals.

8. Uncertainty & Risk Management (Peter)
- Operates effectively with incomplete information, making probabilistic or safe decisions.

9. Adaptive Communication (Ava)
- Adjusts outputs, tone, and format based on audience, intent, and situation.

10. Creativity & Cross-Domain Thinking (Alice)
- Generates novel ideas and applies knowledge across different domains.

11. Event-Driven Autonomy (Peter)
- Initiates actions based on triggers, timelines, or real-time signals without prompting.

12. Resource & Efficiency Optimization (Alice)
- Manages time, tools, and compute to achieve goals with minimal waste.

We created a list of potential capabilities AI Agents could conduct.

Afterwards, we each took two capabilities to matchmake with.

IDEATION
REFLECTION

Ideation Reflection

Our matchmaking ideation led us to a lot of ideas, but the ones that stuck out were ideas about **structure reasoning & decomposition, adaptive communication, and memory & context awareness.** These concepts were personally the most interesting to us and offered the most potential for ideation, flexibility, and real-world impact and feasibility. Our next stage was to focus on particular industries and contexts we thought these areas would serve the most value in; when progressing to matchmaking, we simultaneously focused on these goals while also implementing a creative, wide range of use cases.

MATCHMAKING

Brooke's Matchmaking

Autonomous Goal Execution					Ranking						
	Specific Capability	Domain and/or Activity	Customer	Application	Financial viability		Technical feasibility		Desire/Acceptance		Rank
					1-5	Rationale	1-5	Rationale	1-5	Rationale	1-19
1	Autonomous Goal Execution	Outreach emails	Companies	Find desired guests, write emails to them asking for x, send emails	5	lots of ROI potential with large audience	2	may be too advanced, there's a lot of moving parts involved	5	there are many users who would utilize this product	12
2		Marketing campaigns	Companies	Create marketing materials, distribute them among proper audiences (through email, social media, etc.), achieve marketing objectives	3	mid ROI potential with large audience	3	advanced, there's a lot of moving parts involved but features like these exist	4	ethical issues but paths around it (i.e. AI marketing materials), too helpful	10
3		Auto-responder	Companies	Craft auto responder that must reach x amount of responses a day to requests/questions a company receives	4	large ROI potential with large audience	2	may be too advanced, there's a lot of moving parts involved	4	there are users who would utilize this product	10
4		Newsletter / specific company project	Companies	Input large goal (i.e. post newsletter) and get actionable, small but progressive steps to achieve goal	3	mid ROI potential with large audience	2	may be too advanced, there's a lot of moving parts involved	2	not much of a need or audience for this consistent tool	7
5		**Meeting creation**	**Companies**	**"Make a meeting" -> creates checklist for the meeting (i.e. meeting link, email reminders, content, etc.),**	5	lots of ROI potential with large audience	3	advanced, there's a lot of moving parts involved but features like these exist	4	there are users who would utilize this product	12

Brooke's Matchmaking

Collaboration & Multi-Agent Coordination					Ranking						
	Specific Capability	Domain and/or Activity	Customer	Application	Financial viability		Technical feasibility		Desire/Acceptance		Rank
					1-5	Rationale	1-5	Rationale	1-5	Rationale	1-19
1	Human-agent collab	Task collaboration	Companies (small specifically)	serves as AI PM that breaks goals down into tasks and assigns them to different agents, informing human of progress	4	large ROI potential with large audience	3	apps like this exist	4	there are users who would utilize this product	11
2		Customer Service	Companies	agents help w/ customer service response, humans approve/send their messages	4	large ROI potential with large audience	4	apps like this exist	3	potential ethical + data privacy issues	11
3	Social media	Social media	Companies	create posting schedule, video ideas, schedule posts, and track metrics	4	large ROI potential with large audience	3	some apps like this exist	4	there are users who would utilize this product	11
4		Social media	Companies	creates video ideas and scripts with agents pursuing different roles (i.e. writer, fact checker, editor, etc.)	2	mid ROI potential with mid audience	3	some apps like this exist	3	there are some users who would utilize this product	8
5	**Competitve analyses**	**Market research**	**Companies**	**collect data from various sources (i.e. store reviews) and synthesize findings to one report for human**	3	large ROI potential with mid audience	4	apps like this exist	4	there are users who would utilize this product	11

Peter’s Matchmaking

Creativity & Cross-Domain Thinking

Domain and/or Activity	Customer	Application	FInancial Liability	1-5	Technical Feasibility	1-5	Desirability	1-5	Total
Urban Planning	City Offices	Model infrastructure using ecological systems think	low ROI, high amount of da	2	high quality data exists	5	streamline city planning	4	11
Marketing	Brand Teams	Create campaigns using cross-industry trend synth	low demand, low ROI	2	prediction based on data	5	streamlines ideation process	3	10
Museums	Curatorial Teams	Build exhibits using AI + participatory systems	low demand, small market	2	haven't seen AI in the curatorial s	3	streamline curatorial process	2	7
Insurance	Risk Teams	Use climate models for risk prediction systems	high demand, saves money	4	needs to be super reliable	3	avoid risky situations	3	10
Agriculture	AgTech Teams	Apply robotics + AI to crop management	save money	4	not sure	3	reduce human error	3	10

Uncertainty & Risk Management

			FInancial Liability	1-5	Technical Feasibility	1-5	Desirability	1-5	Total
Finance	Risk Teams |	Model market volatility and scenario outcomes	High ROI, established budget for risk tools	4	Complex tooling exists	4	high demand industry	4	12
Cybersecurity	Security Teams	Detect anomalies and anticipate attack vectors	High upfront, huge cost savings from prevention	4	Well-studied problem, strong model availability	4	Urgent and growing demand across all sectors	5	13
Pharma	R&D	Predict trial success and failure likelihood	money saved from failed trials	4	Data-rich domain, models proven in research	5	demandto reduce trial failures	5	14
Startups	Founders	Run scenario planning for strategic decisions	Low cost tool, high strategic value	4	Relatively simple,	5	High demand, founders lack access to advisory resources	5	14
Insurance	Actuarial Teams	Assess claim probability and pricing risk	Low cost, high ROI on risk reduction	4	Structured data; models already exist	5	High demand for faster, accurate underwriting	4	13

Alice’s Matchmaking 1

Creativity & Cross-Domain Thinking

Domain and/or Activity	Customer	Application
Urban Planning × Environmental Science	City planners	AI proposes creative city layouts that merge ecological principles with human-centered design (e.g., gamified green spaces).
Retail × Social Media Trends	E-commerce brands	Generate trend-based product ideas or listings by blending current TikTok trends with inventory data.
Entertainment & Media	Streaming platforms	Hybrid content formats (e.g., interactive shows blending gaming + film + social media participation). Like Bandersnatch from Netflix
Legal Services	Law firms	Reframing legal documents as visual stories or timelines, combining law + UX design + storytelling to improve client understanding.
Nonprofits / Social Impact	advocacy groups	Designs emotionally compelling campaigns by merging storytelling, data visualization, and cultural narratives.

Alice’s Matchmaking 2

Resource & Efficiency Optimization		
Hospitals	Nurses	Briefing nurses on their shared patients, medicines, notes, etc. Minimize briefing time in-between shifts.
Pharmaceutical	Customer	Remind and reorder patients on their perscriptions, notifying the customer
Hospitality	Travelers	Hotels will be able to redistribute rooms, cleaning staff, customers, etc. based on availability. AI agent will automate this process
Airlines	Air Traffic Control	Rescheduling flights after delays and updating flyers
Website	web designers	Automatically updating website text to fit SEO

Davis' Matchmaking

Tool & Environment Interaction

Domain and/or Activity	Customer	Application
IT Resolution	Any Company with IT	Detect and execute fixes, Write reports
Marketing	Marketing Dept.	Launch campaign, monitor/allocate campaign budget, A/B testing
Finance	Companies with many transactions	Match transactions, flag anomalies, prepares reports for human intervention
Transportation/Delivery	Delivery Companies	Dynamically assigns drivers, reroutes deliveries.
Sales	Any company	Listens to meetings, sends follow-ups, updates boards, schedules meetings

Self-Improvement Loop

Sales	Consulting Firms	Track win/loss, view client feedback, Rewrite future proposals
Customer Support	SaaS	Identifies weak responses, retrains to fix this, self-improve responses
Industrial	Factories	Sees high-friction points, Learns from past factory failures, Improves fix-time accuracy, adjusts maintenance schedules
Customer Support	Subscription Companies	Learns what causes customer retention and what pushes away, suggests certain activities to boost customer outreach/retention
Retail	Brands/Distributors	Sees what seasonal items are wanted more in certain locations, directs shipping to those locations.

Katie’s Matchmaking

Structured Reasoning & Decomposition		
Domain and/or Activity	**Customer**	**Application**
Insurance claims processing	Mid-size insurance firm	Agent breaks each claim into liability, coverage, and documentation sub-tasks, routes each to the right reviewer, and flags missing info before a human adjudicator makes a final decision.
IT helpdesk triage	Corporate IT department	Agent decomposes incoming tickets into symptom, affected system, and urgency, then follows a decision tree to resolve common issues autonomously or escalate with a structured summary.
Grant writing	Nonprofit development team	Agent splits a grant application into sections (need statement, budget, evaluation plan), generates a draft for each, and presents them to a staff writer for review and assembly.
Compliance checklist review	HR/legal team	Given a new regulation, the agent decomposes it into discrete obligations, maps each to existing policies, identifies gaps, and produces a prioritized remediation list for a compliance officer.
Project scoping	Freelance consultant/agency	Agent takes a client brief and breaks it into phases, deliverables, dependencies, and risk factors. Outputs a structured scope-of-work document for the consultant to refine and approve.

Memory & Context Awareness		
Domain and/or Activity	**Customer**	**Application**
Customer support	E-commerce or SaaS company	Agent retains the full history of a customer's past orders, issues, and resolutions across sessions so each interaction picks up in context without making the customer repeat themselves.
Clinical documentation	Primary care physician	Agent remembers patient history, prior visit notes, and medication changes across appointments, automatically surfacing relevant context to the provider during each new encounter.
Sales follow-up	B2B sales representative	Agent tracks every touchpoint with a prospect (emails, calls, stated objections, and agreed next steps) and drafts contextually aware follow-up messages for the rep to review and send.
Employee onboarding	HR/people ops team	Agent maintains a running record of each new hire's completed tasks, open questions, and preferences. Personalizes daily check-ins and pulls the right resources at the right time.
Ongoing legal matter management	Small law firm	Agent holds long-term context across a case's filings, deadlines, and correspondence. It automatically flags conflicts with past decisions or upcoming due dates when a new document arrives.

Ava’s Matchmaking 1

Adaptive Planning and Replanning

Domain and/or Activity	Customer	Application
Project Management	Product Manager	AI agent creates sprint plan and automatically reassigns tasks when blockers arise or timelines shift
Consulting	Strategy Consultant	Replans client deliverables based on new data or changing client priorities mid-project
Supply Chain	Operations Manager	Adjusts logistics routes and inventory plans in real time based on delays or shortages
Healthcare Admin	Hospital Coordinator	Dynamically reschedules staff and patient appointments when emergencies occur
Event Planning	Event Manager	Replans event timelines, vendors, and logistics when cancellations or delays happen
Software Engineering	Engineering Lead	Updates development roadmap when bugs, dependencies, or resource constraints emerge
Sales	Sales Manager	Adjusts outreach strategy based on response rates and pipeline changes
Finance	Financial Analyst	Reforecasts budgets dynamically based on real-time spending or market changes
Marketing	Campaign Manager	Reallocates ad spend and adjusts campaign timelines based on performance data
HR / Recruiting	Recruiter	Replans hiring pipeline when candidates drop out or role requirements shift

Ava’s Matchmaking 2

Adaptive Communication

Domain/Activity	Customer	Application
Corporate Communications	Internal Comms Manager	AI rewrites company announcements for executives, employees, and external audiences differently
Sales	Account Executive	Adjusts pitch messaging based on client personality, industry, and engagement signals
Customer Support	Support Agent	Tailors responses based on customer sentiment (angry vs confused vs casual)
Consulting	Consultant	Converts complex analysis into executive summaries vs detailed reports
HR	HR Manager	Adapts sensitive communications (layoffs, feedback) to tone and individual employee context
Legal	Corporate Lawyer	Translates legal language into plain English for business stakeholders
Marketing	Content Strategist	Rewrites content for different platforms (LinkedIn vs TikTok vs email)
Healthcare	Doctor / Admin	Adjusts explanations of diagnoses for patients vs medical professionals
Education	Instructor	Adapts teaching explanations based on student comprehension level
Product Management	PM	Converts technical product specs into stakeholder-friendly updates

CONCEPT CARDS

Brooke’s Concept Card #1

Concept Card					
Title	Meeting creation				
Description	Make a meeting that does all the busy work tasks for you: creates the checklist for the meeting, the meeting link, sends email reminders, the slide deck, and sends summaries from the meeting.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Companies	**Do / Act**	Based on the content described by the user (or gathers signs that a meeting will commence, i.e. as described in emails), the AI agent begins to start the process of first making a meeting and creating a link. From there, it will create the content needed with a checklist for the meeting, send email reminders for all parties present, will attend the meeting to make the summary for afterward and will send it out immediately when the meeting is finished.	**Data 1**	Companies spend $37B on meetings a year (link)
End User	Company employees			**Data 2**	46% of professionals have 3 or more meetings day (link)
Company or Department	Anywhere/one that regularly meets	**Infer / Reason**	Infer that a meeting should commence based on the signs from a user's inbox. Since I'm targeting meeting creation, it seems more natural to make businesses my target audience. The biggest threat to this idea would be the external collaborators would be the fact that the AI Agents can create the content which may take away the opportunity from preexisitng, human designers.	**Data 3**	AI Agents likely contribute to higher revenues for companies when scenarios are explored (link)
Impacted Individuals	Company employees Design freelancers/consultants (for creating slidedeck co Meeting platforms			**Data 4**	Average Fortune 500 company engages 300+ freelancers annually (link)

Brooke's Concept Card #1 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	increases revenue and optimization, decreases time wasted	**High** / Medium / Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	increases revenue and optimization, decreases time wasted	**High** / Medium / Low
Service Value (Revenue): To what degree will this application generate revenue?	increases revenue and optimization, decreases time wasted	**High** / Medium / Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	increases revenue and optimization, decreases time wasted	**High** / Medium / Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	billions of people work in companies with a big meeting culture	**High** / Medium / Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	economic opportunities may be harmed but this is an ongoing, existing trend	High / Medium / **Low**
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	companies can save money on freelancers and time wasted in meetings but introducing agents to cut out the busy work that comes with meetings	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	data can be collected from millions of employees with overlapping schedules and AI Agent can learn over time	**High** / Medium / Low
Minimum Performance: How well does the model need to perform for users to experience value?	meetings have to be usable with comprehendable summaries and content	**Excellent** / Good / Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	always a possibility but seems low in this cas (unless the people meeting are working in specific instances that involve diversity which may introduce more bias risks)	High / **Medium** / Low
Error Frequency: How frequently would errors occur?	errors are unlikely	High / Medium / **Low**
Error Severity: How severe would an error be?	not the best but not the worst	High / Medium / **Low**
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	monetary loss could occur if frequent errors occur or data for a project is especially off	High / **Medium** / Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	overall, errors seem relatively lowstakes and unlikely but if frequent, potential real loss could occur	

Brooke’s Concept Card #1 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	training and data collection would take a minute	**High** Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	i don't think it would be very expensive to maintain	High Medium **Low**
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	sustainability would be impacted because this would increase AI use for billions	High **Medium** Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	sustainability concerns with the billions of people using the AI but these groups are likely integrating AI into the work regardless	
Judgment		
This idea is a:	real value can be derived from this product. there is reason to explore	**Keeper** Maybe Show-Stopper

Brooke's Concept Card #2

Concept Card					
Title	Competitve analyses				
Description	Data collection from various sources (i.e. store reviews) online and synthesize findings to a report				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Companies	**Do / Act**	User tells AI Agent what types of sources they need it to research (i.e. similar businesses, strategies, etc.) and the agent will search the web for these sources. After searching, they will report what they saw in a complete research/data analysis finding report for the user.	**Data 1**	Nearly 246K people in data science currently (link) so there is a need for people who can perform these tasks
End User	Company employees			**Data 2**	There is no average amount of time spent or frequency with these tasks, so this can make it the process more regular (link)
Company or Department	Companies with high competition (large markets?)	**Infer / Reason**	The AI Agent will have to be particular in the sources it selects and the specific pieces of data that they're researching.	**Data 3**	40% of companies now have AI integrated into some section of their business (link) - others don't want to be left behind
Impacted Individuals	Marketers Consultants			**Data 4**	There are nearly 942k people who are market research analysts (links)

Brooke's Concept Card #2 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	increases revenue through competitive comparisons	**High** Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	increases revenue through competitive comparisons	**High** Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	increases revenue through competitive comparisons	**High** Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	more specific and personalized strategy -> increased brand strategy -> more customer retention	**High** Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	millions of businesses exist	**High** Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	jobs may be risked but not at large or rapid extents	High Medium **Low**
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	there is a lot of revenue potential without the risk of severe loss (to the job market, which is probably where the biggest loss would be felt)	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	there are similar existing sources	**High** Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	as long as it performs somewhat accurately, the benefits exist	Excellent Good **Moderate**
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	if there is bias, it will not be impactful since this is a quantative-backed system	High Medium **Low**
Error Frequency: How frequently would errors occur?	errors would likely occur just in mathematical or data collection instances, both highly unlikely	High Medium **Low**
Error Severity: How severe would an error be?	as long as it performs somewhat accurately, the benefits exist	High Medium **Low**
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	potential monetary loss if heavily reliant upon these skills	High Medium **Low**
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	overall, errors seem relatively lowstakes and unlikely but if frequent, potential real loss could occur	

Brooke’s Concept Card #2 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	similar services likely already exist	High Medium **Low**
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	i don't think it would be very expensive to maintain	High Medium **Low**
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	potential job loss and sustainability concerns from mass usage	High **Medium** Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	sustainability concerns with the billions of people using the AI but these groups are likely integrating AI into the work regardless	
Judgment		
This idea is a:	real value can be derived from this product. there is reason to explore	**Keeper** Maybe Show-Stopper

Peter’s Concept Card #1

Concept Card					
Title	CrossCurrent				
Description	An AI agent that scans trends across industries and synthesizes them into actionable marketing campaign concepts.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Marketing/Brand teams within companies, advertising agencies	**Do / Act**	Create campaigns using cross-industry trend synthesis	**Data 1**	Social and cultural trend platform data
End User	Marketing and creative professionals generating campaign concepts and direction			**Data 2**	Industry news and trade publication feeds
Company or Department	Marketing department/companies	**Infer / Reason**	Infers cross-industry patterns and adapts them into campaign concepts	**Data 3**	Competitor and brand campaign databases
Impacted Individuals	Brand managers, creative strategists, copywriters, designers, and social media managers			**Data 4**	Consumer sentiment and review data

Peter's Concept Card #1 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	MEDIUM -Provides insights that help support teams come up with campaigns, low need for cross industry campaigns	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	MEDIUM - possible to streamline creative and research process	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	LOW - could drive sales up indirectly through effective work, humans still need to create the campaign.	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	LOW - displace employees, lead to less creative team	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	HIGH - Used everytime someone needs a campaign	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	LOW - low stakes situation + enviornment	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Low demand, risks of decreasing creativity,	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	HIGH - tons of trends data from media and economy	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	MEDIUM - harmful market trends could be reinforced	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	LOW - generates based on successful campaigns, could reinforce ideas present in those	High Medium Low
Error Frequency: How frequently would errors occur?	LOW - it wouldn't be an error. it just be a bad idea	High Medium Low
Error Severity: How severe would an error be?	LOW - low stakes as its just a starting point and humans are heavily involved	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	LOW - possible use for propoganda but all marketing is meant to influence	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Good data and low risk	

Peter’s Concept Card #1 Rating (Cont)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	MEDIUM - large amounts of data required	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	MEDIUM - not sure	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	MEDIUM - this is a decision support too, it could lead people becoming less creative	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Its a specific tool, can't be applied to very many use cases and theres low demand for cross industry campaigns	
Judgment		
This idea is a:	Maybe	Keeper Maybe Show-Stopper

Peter’s Concept Card #2

Concept Card					
Title	ForeSight				
Description	An AI agent that models strategic decisions under uncertainty, stress-testing scenarios to help founders anticipate risk and choose the best path forward.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	early stage startups	**Do / Act**	Run scenario planning for strategic decisions	**Data 1**	Market and industry trend data
End User	Founders			**Data 2**	Competitor and funding landscape data
Company or Department	Executive / Strategy	**Infer / Reason**	Evaluates strategic options under uncertainty and models likely outcomes across best, base, and worst-case scenarios	**Data 3**	Macroeconomic and regulatory signals
Impacted Individuals	Investors, advisors, and leadership team			**Data 4**	Internal startup metrics and financials

Peter's Concept Card #2 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - helps founders/businesses navigate decisions	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - better decision making = higher revenue	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	MEDIUM - could increase revenue, but overreliance may lead to poor judgement	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	HIGH - users feel more condfident about their decisions	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	HIGH - everytime choices arise and a decision needs to be made	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	HIGH - bad business could be blamed on the agent, decreased risk taking and self-assurance	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	could be helpful as a tool, but not as a final decision maker	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	Medium - depends on industry	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	Excellent - if it performs poorly people won't use again	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	High - harmful market trends could be reinforced	High Medium Low
Error Frequency: How frequently would errors occur?	Medium - unsure	High Medium Low
Error Severity: How severe would an error be?	Medium - depends on the stakes of the situation its used in	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	Medium - people could use this to sabatoge compeitiors	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	The data will vary across industries, and risks varies across situation	

Peter’s Concept Card #2 Rating (cont)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	HIGH - large amounts of data required, paremeters need to be built to prevent overreliance	**High** Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	MEDIUM - not sure	**High** Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	MEDIUM - this is a decision support too, it could lead people to make bad decisions though	**High** Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	complictaed tool, expensive, high risk, potential high reward	
Judgment		
This idea is a:	Maybe	**Keeper** Maybe **Show-Stopper**

Alice’s Concept Card #1

Concept Card					
Title	Hospital Briefing				
Description	Briefing nurses on their shared patients, medicines, notes, etc. Minimize briefing time in-between shifts.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Hospitals	**Do / Act**	The system should be able to automatically generate shift summaries, log and track updates, and make the schedule for nurses based on risks, necessity, and urgency.	**Data 1**	Patient Clinical Data
End User	Nurses			**Data 2**	Medication & Treatment Data
Company or Department	Hospitals/Medical	**Infer / Reason**	Detect clinically relevant changes; combine vitals, diagnoses, and history; and assess patient risk	**Data 3**	Nursing Notes & Communication
Impacted Individuals	Medical staff, patients, families, insurance			**Data 4**	Operational / Workflow Data (ex. what rooms they've been in)

Alice's Concept Card #1 Rating

Does Anyone Want This?

User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	high. would improve workflow, reduce burnout, and save time	High / Medium / Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	high. hospitals care about efficiency, reducing errors, and it aligns with operational and clinical goals	High / Medium / Low
Service Value (Revenue): To what degree will this application generate revenue?	medium. hospitals would pay but requires long sales cycles and heavy compliance requirements	High / Medium / Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	high. improves patient safety and enhances hospital quality metrics	High / Medium / Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	high. used for every shift change	High / Medium / Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	high. omits critical info and incorrect info would directly impact patient safety	High / Medium / Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	very strong demand and clear value, but posts red flags	

Can This Be Built?

Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	medium. hospitals have rich data but fragmented systems, messy notes, and inconsistent formatting	High / Medium / Low
Minimum Performance: How well does the model need to perform for users to experience value?	excellent. needs to be highly accurate, reliable, and consistent	Excellent / Good / Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	medium. bias may appear in documentation quality	High / Medium / Low
Error Frequency: How frequently would errors occur?	medium. LLMs summarizing messy clinical notes may hallucinate details and miss edge cases	High / Medium / Low
Error Severity: How severe would an error be?	high. a missed allregy, medication, condition, etc. can lead to serious patient harm	High / Medium / Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	low. less about external misuse and more about internal over-trust	High / Medium / Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	technically feasibile but extremely high bar for reliability	

Should This Be Built?

Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	high. need EHR integrations, HIPAA compliance, human-in-loop systems	High / Medium / Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	medium. frequent summarizations, secure infrastrucutre, and needs real-time updates. costs are manageable	High / Medium / Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	medium. might lead to over systemic reliance on inperfect AI	High / Medium / Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High cost and high responsibility but also high impact	

Judgment

This idea is a:	Maybe. high potential, high risk	Keeper / Maybe / Show-Stopper

Alice’s Concept Card #2

Concept Card					
Title	Room Redistribution				
Description	Hotels will be able to redistribute rooms, cleaning staff, customers, etc. based on availability. AI agent will automate this process				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Hotels / Hostel owners	**Do / Act**	Dynamically assign rooms; Optimize housekeeping schedules; Manage guest flow	**Data 1**	Room & Inventory Data
End User	Front desk			**Data 2**	Booking & Guest Data
Company or Department	Hospitality	**Infer / Reason**	Predict room availability, Prioritize actions, Anticipate demand	**Data 3**	Staff & Operations Data
Impacted Individuals	Travelers, front desk, customer service, custodial staff			**Data 4**	Real-Time Event Data

Alice's Concept Card #2 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	high. hotel managers and operations staff would want to reduce manual coordination, optimize room allocation and housekeeping, and handle last-minute changes automatically	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	high. hotels care about occupancy rates and guest satisfaction	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	high. saas subscription	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	medium. improves staff coordination	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	high. used daily and in real-time	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	medium. misallocating rooms and poor gues experience	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	strong operation need with clear ROI	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	medium. hotels keep track of room availability and housekeeping status, but data may be siloed across systems and real time accuracy can vary	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	good. doesn't need perfection but staff can override decisions	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	low. less about demographics and more about operational inconsistencies	High Medium Low
Error Frequency: How frequently would errors occur?	medium. dynamic environment --> frequent updates --> occasional mismatches	High Medium Low
Error Severity: How severe would an error be?	low. errors may cuase inconvenience, delays, but are reversible	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	low	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	*very feasible with existing optimization and AI planning systems*	

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	medium. needs to be integrated with PMS systems	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	low	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	low	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	economically viable with relatively low societal risk	

Judgment		
This idea is a:		Keeper Maybe Show-Stopper
	Keeper	

Davis' Concept Card #1

Concept Card					
Title	Customer Support - Subscription Companies				
Description	Learns what causes customer retention and what pushes away, suggests certain activities to boost customer outreach/retention				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Subscription-Based Companies	**Do / Act**	Recommend or trigger outreach strategies, campaigns, c	**Data 1**	Customer Interaction History
End User	Customer Support			**Data 2**	Subscription lifecycle data
Company or Department	Customer Support Teams	**Infer / Reason**	Predict retention patterns	**Data 3**	Product usage metrics
Impacted Individuals	Customer/Subscribers			**Data 4**	

Davis' Concept Card #1 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - Provides insights that help support teams intervene at the right	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - Improves subscription retention and enjoyment of product	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	HIGH - Potential to significantly improve ROI with customer retention	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	MED - Improves understanding of systems across employees	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	HIGH - Used daily for tickets or things similar	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	MED - Risk of over-automating a human-based process	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High adoption with ROI, but risks over-automation	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	MED - May not be high quality	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	HIGH - Model must be calibrated well to be supported	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	MED - May not be high quality	High Medium Low
Error Frequency: How frequently would errors occur?	MED - Data may be noisy	High Medium Low
Error Severity: How severe would an error be?	MED - Could lead to missed opportunities and losing subscribers	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	LOW - External forces couldn't change	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Feasible, but could be rough depending on data cleanliness	

Davis' Concept Card #1 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	MED/HIGH - No cost metric given	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	MED - No cost metric given	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	LOW - Minimal direct	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	No cost metric given	

Judgment		
This idea is a:	MAYBE	Keeper Maybe Show-Stopper

Davis' Concept Card #2

Concept Card					
Title	Retail - Brands/Distributors				
Description	Sees what seasonal items are wanted more in certain locations, directs shipping to those locations.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Retail Brands or Distributors	**Do / Act**	recommend or redirect shipping	**Data 1**	Historical sales
End User	Supply chain managers or workers			**Data 2**	Invetory Levels
Company or Department	Supply Chain	**Infer / Reason**	predict seasonal demand patterns	**Data 3**	External effects
Impacted Individuals	Retail employees			**Data 4**	Logistics

Davis' Concept Card #2 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - Helps decisions be made faster	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	HIGH - Improves product availability	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	HIGH - Increasing sales by better invetory allocation	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	HIGH - improves operational efficiency	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	HIGH - Used immediately and continuously for planning and shipping	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	MED - Incorrect predictions could lead to low stock in high demand	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High-Impact, Medium Risk, High ROI	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	MED - External effects like weather might be tricky, but there is general	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	HIGH - Forecasts have to be pretty accurate to turn a profit	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	MED - Demand may seem low where supply is low	High Medium Low
Error Frequency: How frequently would errors occur?	MED - Unusual seasons or new products may cause errors	High Medium Low
Error Severity: How severe would an error be?	MED/HIGH - Errors would cause high demand areas to have low stock	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	LOW - just used internally	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Technically feasible with stronger data, errors might be influentials	

Davis' Concept Card #2 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	HIGH - Cost metric not given	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	MED - Cost metric not given	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	MED - Could affect job placement	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High complexity but high reward	

Judgment		
This idea is a:	KEEPER / MAYBE	Keeper Maybe Show-Stopper

Katie’s Concept Card #1

Concept Card					
Title	IT helpdesk triage agent				
Description	Agent decomposes incoming support tickets into symptom, affected system, and urgency, then follows a decision tree to resolve common issues autonomously or escalates with a structured summary				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Corporate IT department	**Do / Act**	Parse tickets into structured fields (symptom, system, urgency); auto-resolve common issues (password reset, VPN, printer); escalate complex tickets with a pre-filled summary	**Data 1**	Historical ticket data with resolution outcomes
End User	Employees submitting tickets; IT support staff			**Data 2**	IT asset inventory and system topology
Company or Department	IT operations / help desk team	**Infer / Reason**	Determine urgency from ticket language and affected role; choose resolution path from decision tree; flag patterns indicating systemic outages	**Data 3**	Runbooks and known-issue playbooks
Impacted Individuals	All employees whose issues are resolved faster			**Data 4**	Employee role and priority tier mappings

Katie's Concept Card #1 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	Employees get faster resolution; IT staff spend less time on repetitive L1 tickets and can focus on complex issues	High
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	IT department reduces ticket backlog, lowers headcount cost on tier-1 support, improves SLA compliance	High
Service Value (Revenue): To what degree will this application generate revenue?	Clear ROI story: cost-per-ticket reduction, agent deflection rate. Easily quantifiable for sales	High
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	Improves employee experience and productivity; positions Anthropic in enterprise IT automation market	Medium
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	High volume — every IT ticket goes through it. Broad user base across all employees at a company	High
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	Misrouted tickets could delay urgent issues; incorrect auto-resolutions could cause downtime. Escalation fallback mitigates this significantly	Medium
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Strong demand signal from enterprise IT buyers. Clear cost savings. Low risk if escalation paths are reliable. Watch for over-automation on ambiguous tickets.	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	Historical ticket data widely available in ServiceNow, Jira, Zendesk. Generally high quality with structured fields	High
Minimum Performance: How well does the model need to perform for users to experience value?	Decision-tree + classification task — well within current model capabilities. Structured output is achievable reliably	Excellent
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	Risk of bias toward historically over/under-prioritized teams. Edge cases may reflect past IT practices, not optimal routing	Medium
Error Frequency: How frequently would errors occur?	Misclassification of urgency or system is plausible, especially for novel issues. Frequent but low-stakes errors expected	Medium
Error Severity: How severe would an error be?	Most errors result in mis-routing, not harm. Critical incidents that bypass escalation could be severe but are edge cases	Medium
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	Low risk — internal enterprise tool with authenticated users. Prompt injection via ticket content is a potential vector	Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Technically achievable with current models. Main risks are classification accuracy on ambiguous tickets and injection via free-text fields.	

Katie’s Concept Card #1 Rating

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	Integration with ticketing systems (ServiceNow, Jira) is non-trivial. Decision tree design requires IT domain expertise. Moderate scope	Medium
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	High ticket volume means high inference cost. Token usage per ticket is modest; volume scales cost proportionally	Medium
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	Potential for job displacement of L1 helpdesk workers. Limited broader societal harm given contained enterprise scope	Medium
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Costs are manageable and offset by clear savings. Displacement risk worth acknowledging in positioning. Responsible to build with proper guardrails.	
Judgment		
This idea is a:	Clear demand, buildable, quantifiable ROI. Strong candidate for enterprise automation portfolio.	Keeper

Katie’s Concept Card #2

Concept Card					
Title	Clinical documentation agent				
Description	Agent retains patient history, prior visit notes, and medication changes across appointments, automatically surfacing relevant context to providers during each encounter — including across specialists such as cardiologists and primary care physicians.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Hospital system or primary care practice	**Do / Act**	Surface relevant prior notes, labs, and medication changes at the start of each visit; generate draft documentation; flag cross-specialist gaps or conflicts	**Data 1**	EHR records: visit notes, labs, imaging
End User	Primary care physicians and specialists (e.g. cardiologists)			**Data 2**	Medication lists and prescription history
Company or Department	Clinical operations / health IT	**Infer / Reason**	Determine which historical context is most relevant to the current complaint; detect medication interactions across prescribers; identify care continuity gaps	**Data 3**	Referral and specialist visit summaries
Impacted Individuals	Patients receiving more coordinated, informed care			**Data 4**	Clinical guidelines and drug interaction databases

Katie's Concept Card #2 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	Physicians spend less time on chart review; relevant context surfaces automatically, reducing cognitive load and risk of missing critical history	High
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	Health systems reduce documentation burden, improve care coordination, and potentially reduce adverse events from missed context	High
Service Value (Revenue): To what degree will this application generate revenue?	High willingness to pay in healthcare IT. Clinical workflow tools command premium contracts. Strong revenue potential	High
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	Significant patient safety upside; positions Anthropic in a high-visibility, socially impactful vertical	High
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	Used at every patient encounter across all care settings. Very high frequency once embedded in clinical workflow	High
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	Surfacing incorrect or outdated records could mislead clinical decisions. Patient harm risk is real. Requires physician-in-the-loop validation	High
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Huge demand and impact. Risk is high — patient safety implications mean errors have real consequences. Needs strict human oversight and auditability.	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	EHR data is often incomplete, inconsistently structured, or siloed across systems. Interoperability (HL7/FHIR) varies widely by institution	Medium
Minimum Performance: How well does the model need to perform for users to experience value?	Retrieval and summarization of medical history is within model capability, but hallucination risk on clinical facts is a serious concern	Good
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	Historical EHR data reflects disparities in care access and documentation quality across demographics. Could surface context unequally	Medium
Error Frequency: How frequently would errors occur?	Medical record retrieval errors likely infrequent if well-integrated, but free-text note interpretation introduces noise	Medium
Error Severity: How severe would an error be?	A missed allergy, incorrect medication history, or wrong diagnosis in context could directly harm patients. Severity is high	High
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	Authorized clinical users only; HIPAA-regulated environment. Low misuse risk within system; data breach risk is the main vector	Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	*Technically feasible but EHR integration complexity is high. Error severity demands conservative deployment with physician verification at every step.*	

Katie’s Concept Card #2 Rating

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	EHR integration (Epic, Cerner), HIPAA compliance, and clinical validation require significant investment. High build cost	High
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	Long context windows for patient histories plus high query volume = substantial inference cost. Manageable at enterprise contract pricing	Medium
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	If built well: large positive impact on care quality. If poorly implemented: risk of automating over-reliance, reducing physician vigilance	Medium
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High build cost and stakes, but the societal upside is enormous. Should be built with strict safeguards, clinical advisory, and phased rollout.	
Judgment		
This idea is a:	High impact, high complexity, high stakes. Worth pursuing with the right clinical partners and safety infrastructure.	Keeper

Ava’s Concept Card #1

Concept Card					
Title	Autonomous Sprint Replanning Agent				
Description	An AI agent that helps product managers dynamically plan and replan sprints by detecting blockers, reallocating tasks, and adjusting timelines in real time while keeping the human in the loop for approvals.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Tech Companies/Product Teams	**Do / Act**	Automatically reassign tasks when blockers arise Adjust sprint timelines and priorities Notify team members of changes	**Data 1**	Sprint data (Jira, Asana, task boards)
End User	Product managers, engineers			**Data 2**	Team performance / velocity data
Company or Department	Product/engineering teams	**Infer / Reason**	Detect blockers (missed deadlines, dependencies) Predict delays and workload imbalance Recommend optimal task distribution	**Data 3**	Task dependencies + deadlines
Impacted Individuals	engineers, designers, stakeholders			**Data 4**	Communication logs (Slack, updates)

Ava’s Concept Card #1 Rating

Does Anyone Want This?		
User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	High Reduces manual planning + stress	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance...)	High Improves team efficiency + delivery speed	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	Medium Likely SaaS add-on, not standalone	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	High Better team coordination + morale	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	High Used daily during sprint cycles	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	Medium Over-automation of team decisions	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	High workflow value and daily use. Red flag: loss of human control / over-reliance	

Can This Be Built?		
Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	High Structured task + sprint data available	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	Good Doesn’t need to be perfect to be useful	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	Low Mostly operational (not demographic) data	High Medium Low
Error Frequency: How frequently would errors occur?	Medium Blocker detection may be imperfect	High Medium Low
Error Severity: How severe would an error be?	Medium Bad task reassignment can slow team	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	Low Limited misuse potential	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Technically feasible with existing tools. Red flag: users blindly trusting outputs	

Ava’ Concept Card #1 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	Medium Requires integrations (Jira, Slack)	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	Medium Continuous updates + monitoring	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	Low Mostly internal productivity tool	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Reasonable cost, low external harm. Red flag: over-automation of management roles	
Judgment		
This idea is a:	Keeper	Keeper Maybe Show-Stopper

Ava’s Concept Card #2

Concept Card					
Title	Adaptive Sales AI: Personalized Pitch Agent				
Description	An AI agent that dynamically adjusts sales messaging in real time based on client personality, industry, and engagement signals to improve conversion rates.				
Who are the...		*What should the system..*		*What do we know?*	
Payer (Customer)	Sales organizations / companies	**Do / Act**	Generate tailored sales pitches Adjust tone and messaging in real time Suggest next steps in conversations	**Data 1**	CRM data (customer profiles, history)
End User	Account Executives / Sales reps			**Data 2**	Past sales conversations / emails
Company or Department	Sales / Business Development	**Infer / Reason**	Identify client personality and preferences Analyze engagement signals (responses, tone) Predict likelihood of conversion	**Data 3**	Industry-specific messaging patterns
Impacted Individuals	Clients / prospects			**Data 4**	Engagement data (opens, replies, sentiment

Ava’s Concept Card #2 Rating

Does Anyone Want This?

User Value: How much value do we provide to the end-user? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance…)	High Makes selling easier + faster	High Medium Low
Customer Value: How much value do we deliver to the payer? (e.g., getting the job done, status enhancement, convenience, usability, newness, customization, performance…)	High Direct impact on revenue	High Medium Low
Service Value (Revenue): To what degree will this application generate revenue?	High Clear ROI (conversion rate increase)	High Medium Low
Service Value (Non-revenue): How much non-financial value does this concept add to our service? (e.g. employee engagement, corporate social responsibility, raising awareness, etc)	Medium Improves sales consistency	High Medium Low
Adoption + Frequency of Use: How many new and current users will use this service, and how frequently?	High Used in every client interaction	High Medium Low
Risk to User/Stakeholder: How likely is this to cause harm to end-users or stakeholders? (e.g., their physical or psychological safety, civil liberties or rights, or economic opportunity)	Medium Potential manipulation of customers	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Strong revenue driver. Red flag: inauthentic or manipulative messaging	

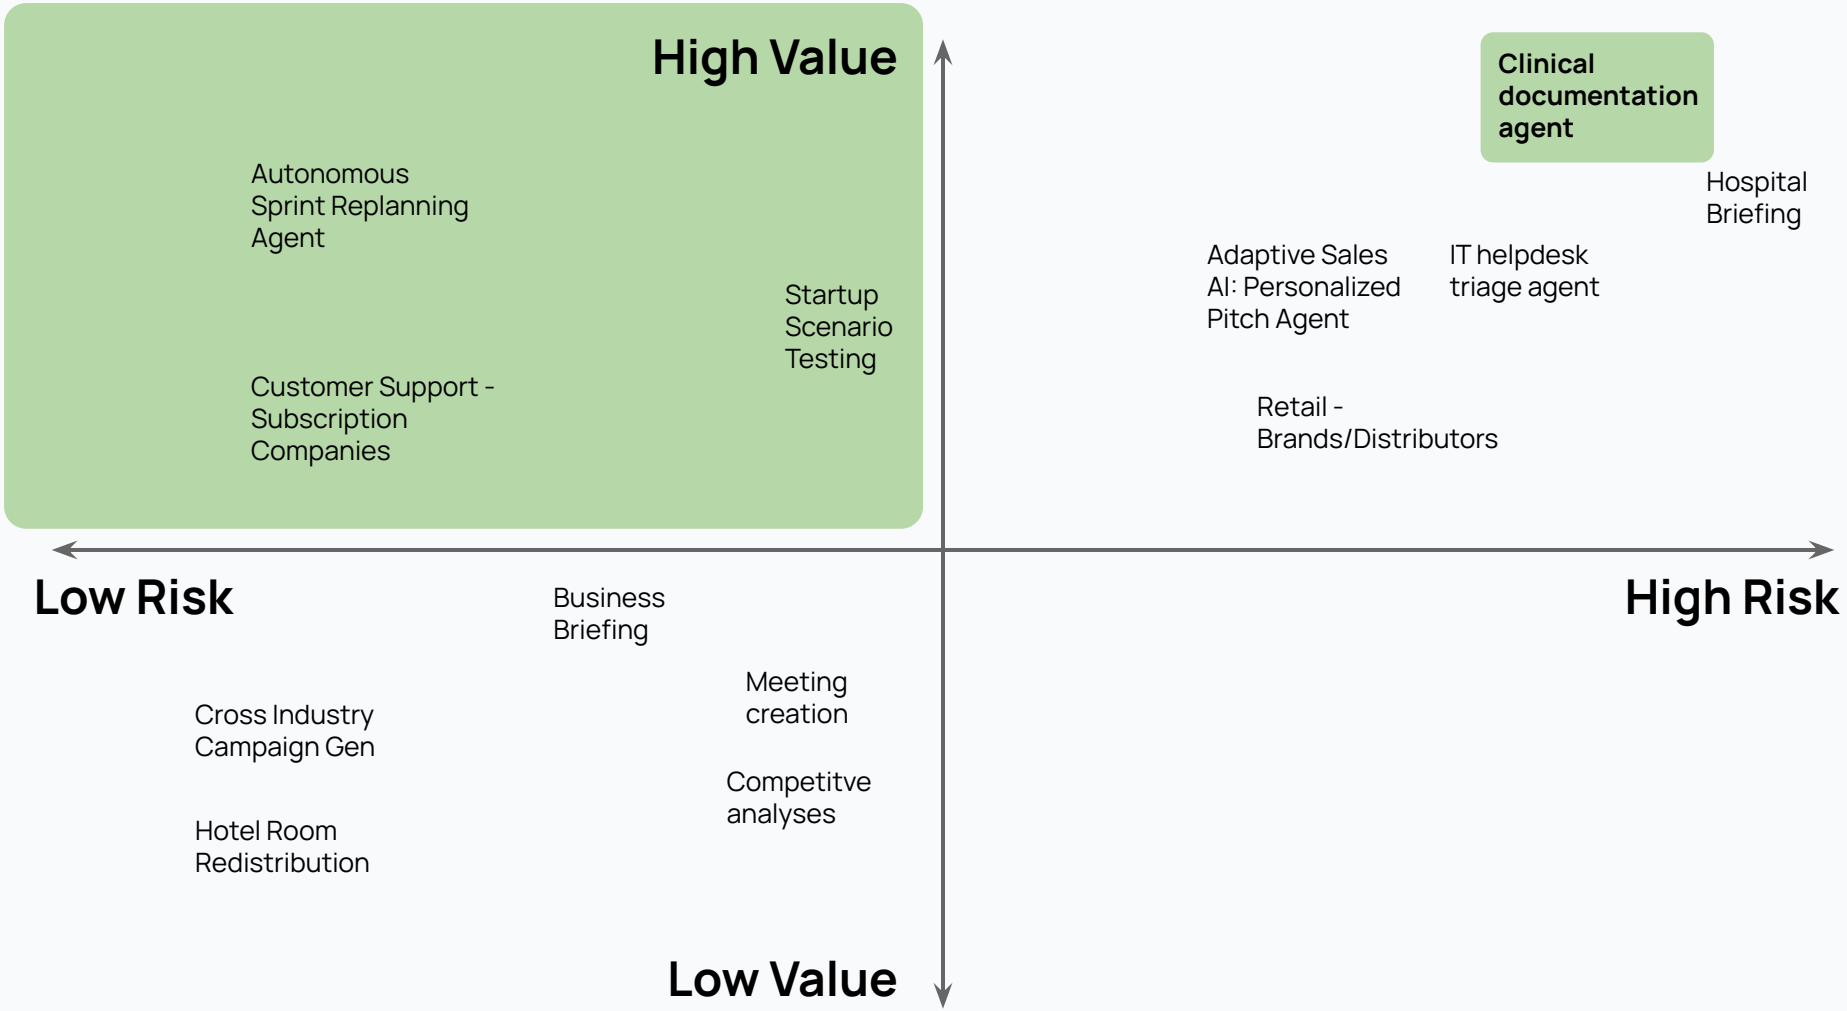

Can This Be Built?

Data Quality: Is there enough high-quality data to achieve 'good enough' model performance? (e.g., think about accuracy, biases, completeness ... of the data)	Medium CRM data often messy/incomplete	High Medium Low
Minimum Performance: How well does the model need to perform for users to experience value?	Good Needs to be reasonably accurate to be trusted	Excellent Good Moderate
Data Bias: Is the data Biased? Will the system perform differently for certain groups or scenarios, potentially causing significant harm?	Medium Biased sales data → biased messaging	High Medium Low
Error Frequency: How frequently would errors occur?	Medium Misreading tone/personality	High Medium Low
Error Severity: How severe would an error be?	Medium Could hurt deals or relationships	High Medium Low
Bad Actors: How easily could bad actors misuse the system to cause harm? (e.g., leading to harming data quality, security breaches, or monetary loss)	Medium Can be used for deceptive persuasion	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Feasible but data-dependent. Red flag: biased or misleading outputs	

Ava’ Concept Card #2 Rating (cont.)

Should This Be Built?		
Build Costs: How expensive/time-consuming to build a dataset, develop a model, or fine-tune a pre-built model? (e.g., systems license, programming, data collection, employees, training, etc)	Low–Medium LLMs + CRM integration	High Medium Low
Run Costs: How expensive would it be to run? (e.g., electricity, frequency of updating and retraining the model, data storage, computing power requirements, etc)	Medium Frequent usage = ongoing compute	High Medium Low
Societal Harm: How likely is it that this will indirectly cause societal harm? (e.g., job loss, sustainability, etc)	Medium Risk of manipulation at scale	High Medium Low
In Summary: Explain the rationale behind your ratings in this category. Be concise. Add a few words for a red flag. (e.g. "people will misuse", "teachers will feel uncomfortable")	Easy to build, harder to control ethically. Red flag: scaling persuasion tactics

SELECTION OF CONCEPT + CRITERIA ASSESSMENT REFLECTION

Selection of Concept

We reviewed each concept card strategically, measuring: user value, customer value, revenue upside, build-and-run effort, data availability, and risk. While we were advised in lecture to follow a high-value, low-risk idea, we didn't feel as connected to these ideas. They were safe but boring and likely pursued already in the real-world. We wanted to choose something different that would make for real-world impact, if implemented. After discussing preferences, we decided to pursue the clinical documentation agent. Despite it being a high-risk idea, we thought it provided the most value and was a worthwhile investment, so we selected it as our topic.

VALUE FLOW MODEL

Value Flow Model

Hospital/EHR	Health Connect	Clinical Staff	Patient
Inputs:	**AI Actions:**	**Human Oversight:**	**Patient:**
• Epic FHIR data • Discharge trigger • Patient chart	• Auto-scheduling • Comms drafting • Conflict flagging • Med reconciliation	• Reviews AI output • Confirms actions • Full audit trail	• Summaries • Meds delivered • Follow-ups booked • Fewer readmissions

TOKEN & COST ESTIMATE PER DISCHARGE TRANSACTION

Patient Summary	Med Reconciliation	Auto-Scheduling	Patient Comms	TOTAL
In: ~3,000 Out: ~500 $0.02	In: ~4,000 Out: ~800 $0.03	In: ~2,000 Out: ~400 $0.02	In: ~1,500 Out: ~600 $0.01	In: ~10,500 Out: ~2,300 $0.08

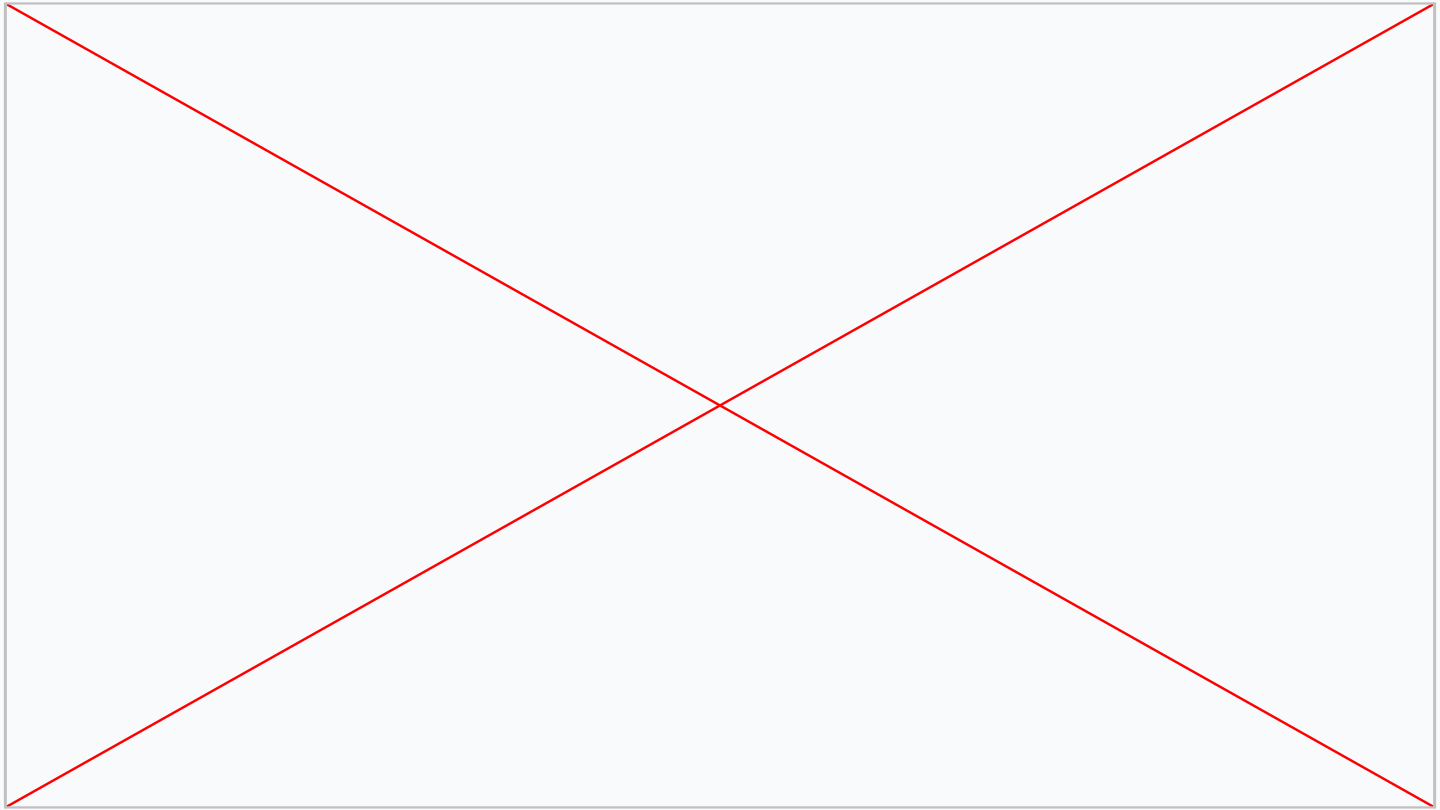

JOURNEY MAP

Journey Map Before Health Connect

STAGES	A patient is sent to the hospital.	A patient is treated at the hospital.	Nurse prepares for patient discharge.	Patient is discharged	Patient continues perscribed care.
USER ACTION	Patient admits themself. They give their medical info.	Nurse inputs medication and details visit	Nurse prepares plan, schedules transport., lists medication, etc.	Patient relies on scheduled transport to get back home	Patient wonders when medical machinery and first perscription order will arrrive
TOUCHPOINTS	Front desk. Paperwork	Electronic Health Records	Emergency contacts, EHRs, pharmacies	Traffic, emergency contacts, personal information.	Pharmacies, doctor's contact, any health portal
OPPORTUNITIES	Connecting insurance, paperwork, personal info., etc. online.	This automatically updates a medical schedule for patient	System uses' user's input to already contact and schedule potential rides, pharmacies, etc.	Looking at routes back home, and ensuring contact between the driver and the patient.	Already having necessary things delivered from personal info. Or having them scheduled in advance

TECHNICAL PROTOTYPE

Video Demo of Health Connect’s Discharge Hub

FINANCIAL CASE

Financial Case

Health Connect targets a large market with a clear problem. U.S. hospitals process approximately 37 million discharges annually, and the fragmented, manual nature of this process costs the healthcare system billions in preventable readmissions and CMS penalties every year. At a price point of $50 per discharge, the **total addressable market (TAM) sits at roughly $1.85 billion**.

Our go-to-market entry focuses on hospitals currently penalized under the Hospital Readmissions Reduction Program (HRRP), a CMS initiative that fines hospitals with above-average readmission rates. This group represents our **serviceable addressable market (SAM) of approximately $350 million**, and it is ideal because these hospitals have an immediate, measurable financial incentive to reduce readmissions. For them, Health Connect is not just a nice tool but a direct defense against ongoing government penalties.

In Year 1, capturing just **0.1%** of SAM yields approximately **$1.85 million in revenue**. By Year 3, reaching 1% penetration grows that figure to **$18.5 million**. With a total build investment of $750,000 to $1.4 million (covering engineering costs, HIPAA compliance, and Epic EHR integration), this represents a **13x return** on investment at the base case.

Hospitals pay for the platform, clinical staff use it, and patients are the ultimate beneficiaries.

Financial Case

Cost Structure

Build: $744K – $1.4M

- Engineers (12 mo): $350K
- Epic Integration: $350K – $1M
- HIPAA + Maintenance: $40K–$60K

Revenue Model

$50 per discharge
Value driven by:

- Reduced readmissions (CMS penalties)
- Operational efficiency
- Time savings for clinicians

-

Market Opportunity

TAM: $1.85B (37M discharges × $50)
SAM: ~$350M (HRRP hospitals)

Growth Projections

Year 1: $1.85M (0.1% penetration)
Year 3: $18.5M (1% penetration)

Unit Economics

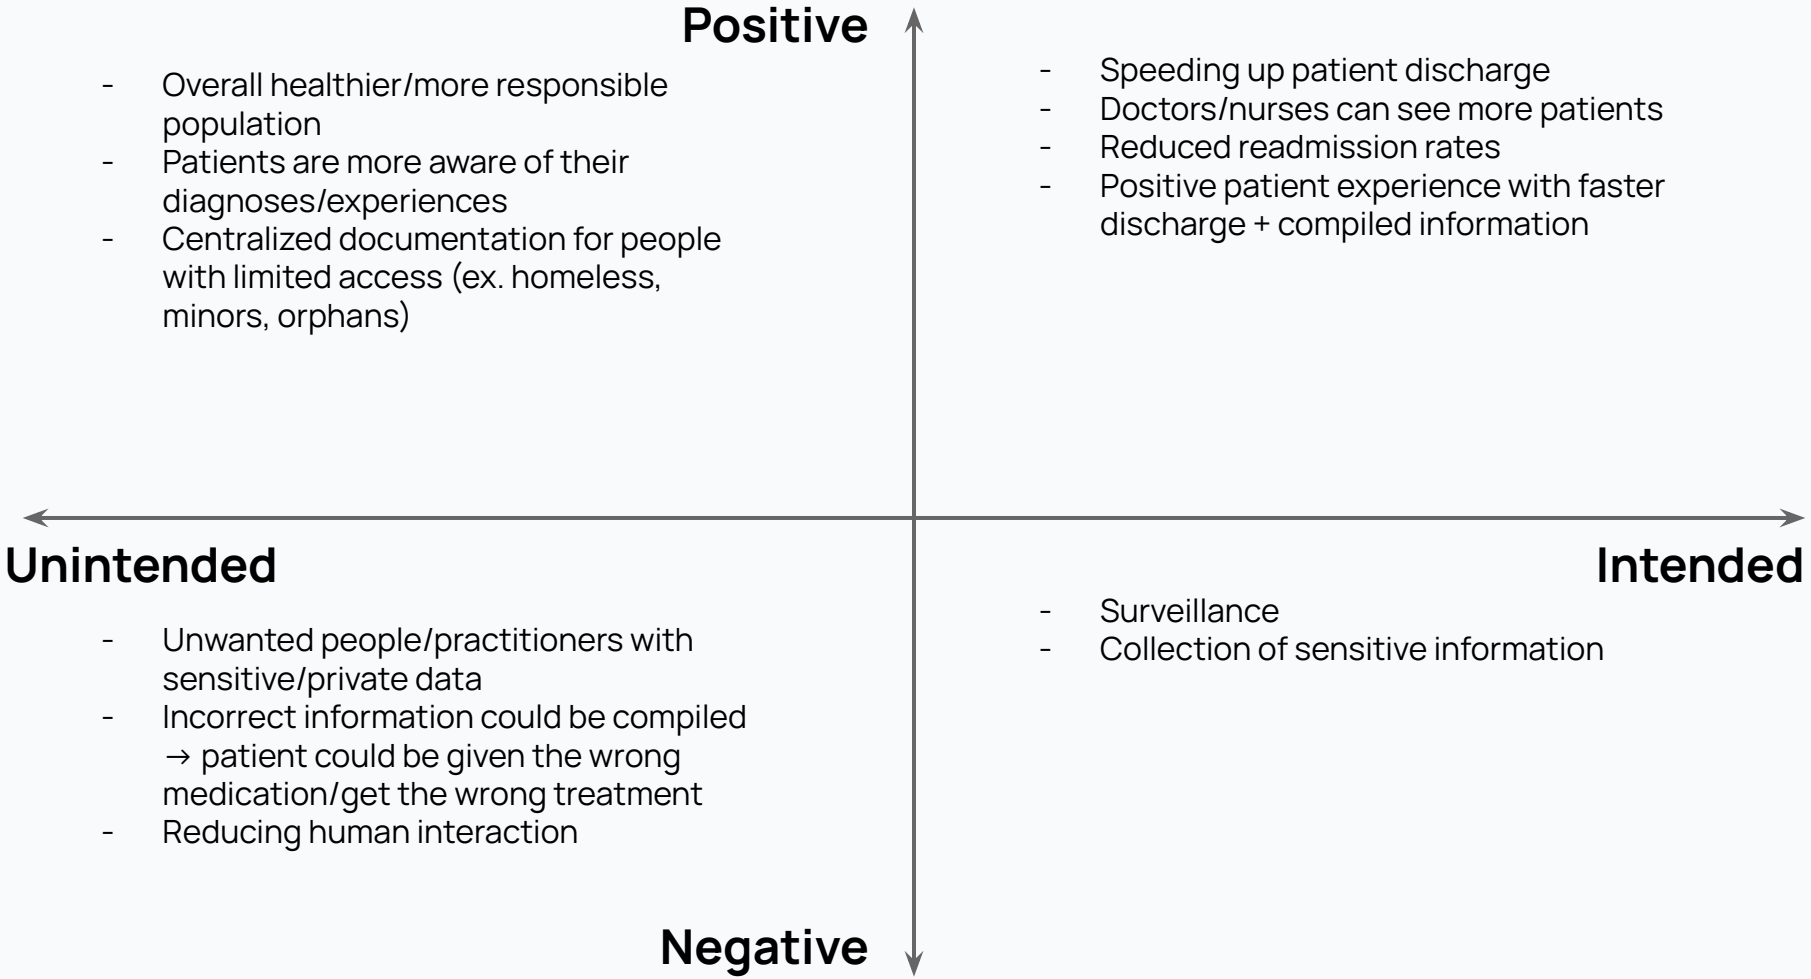

- ~$0.08 per discharge (API cost)
- Highly scalable at national volume (<$3M annually)

Key Insight

- ~13x ROI → strong incentive for hospital adoption

Low marginal cost + high ROI → strong scalability and clear path to adoption

CONSEQUENCE SCANNING

Positive
- Overall healthier/more responsible population
- Patients are more aware of their diagnoses/experiences
- Centralized documentation for people with limited access (ex. homeless, minors, orphans)
- Speeding up patient discharge
- Doctors/nurses can see more patients
- Reduced readmission rates
- Positive patient experience with faster discharge + compiled information
Unintended
Intended
- Unwanted people/practitioners with sensitive/private data
- Incorrect information could be compiled → patient could be given the wrong medication/get the wrong treatment
- Reducing human interaction
- Surveillance
- Collection of sensitive information
Negative

Consequence Scanning: Interpretation

Intended Positives:

- Fewer readmissions: patients follow up, take meds correctly, return equipment on time
- Medication conflicts caught before patient leaves → fewer adverse drug events
- Hospitals avoid CMS HRRP penalties → direct, measurable financial ROI

Intended Negatives:

- AI replaces some administrative tasks: case manager roles may be reduced
- Hospitals absorb implementation cost ($750K–$1.4M) and change management burden
- Liability shifts: questions over who is responsible when AI-assisted discharge has an error

Unintended Positives:

- Staff develop AI fluency with skills transferable across hospital systems and future tools
- Health equity gains → consistent discharge protocols applied regardless of patient background
- Discharge data collected at scale enables future predictive readmission modeling

Unintended Negatives:

- Risk of over-reliance: staff may lose manual discharge skills if AI becomes unavailable
- Digital divide: elderly or low-literacy patients may not engage with SMS/email reminders
- Automation bias: clinicians may over-trust AI flags and under-scrutinize edge cases

DRAFT PITCH SLIDES

The next 13 slides contain our final pitch.

Health Connect

Team 1

BrookeLynn Acevedo, Davis Germain, Alice Kang, Peter Shpelfogel, Ava Shu, Katie Weng

Healthcare is never easy.

The current hospital discharge system is:

Fragmented across EHRs, staff, and external vendors

Highly manual (nurses + case managers coordinating everything)

Error-prone → missed meds, delayed equipment, readmissions

Existing tools show information and are patient focused,
but don't *execute* discharge.

Current Tools

Patient Portals	Care Coordination Platforms	Comm. + Collab. Tools
- Show patient records, meds, appointments - Messaging with providers - Billing + scheduling	- Track patients across settings - Manage referrals + discharge planning - Assign tasks to care teams	- Messaging, alerts, coordination across staff - Real-time updates from EHR systems
These are patient-facing record viewers, not operational systems.	These are coordination dashboards, but not deeply agentic or automated.	These solve communication, not decision-making or execution.

Fairness, Accountability, Transparency, Ethics

Human Oversight

- Every agent action is logged with a full audit trail
- No clinical action is confirmed without human sign-off
- Explainable recommendations — clinicians see what was flagged and why

Built For Trust

- Consistent protocols applied regardless of patient demographics
- PHI encrypted, role-based access, BAAs with all vendors
- Patients receive plain-language discharge summaries

Risks & Mitigations

	Risk	Mitigation
	HIPAA & Unauthorized Access — sensitive PHI collected at scale	BAAs with all vendors, encrypted pipelines, role-based access
	AI Inference Errors — wrong medication or treatment compiled	Human review required before any clinical action is confirmed
	EHR Integration — Epic approval is slow and hospital-by-hospital	Start with read-only FHIR APIs, write-back in later phases
	Liability — who's accountable if something is missed?	Agents assist and log but final sign-off stays with clinical staff
	Sales Cycles — hospital procurement takes 12–18 months	Target HRRP-penalized hospitals with a direct ROI story

Technical Feasibility

Overall technical feasibility: High ✅

Epic FHIR Data

- Structured clinical inputs (meds, allergies, diagnoses)

Preprocessing

- Standardize meds, map diagnoses, extract relevant chart sections

Agent Engine

- Each agent handles one discharge step with human sign-off

LLM Layer

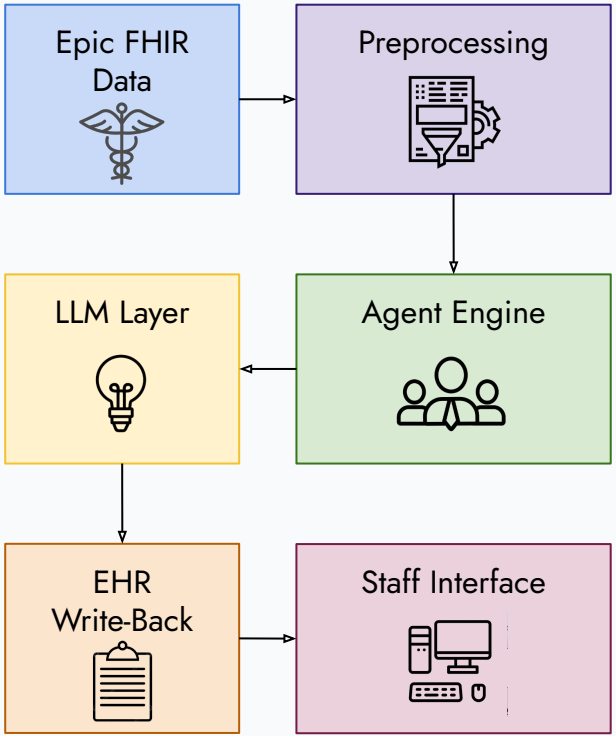

- Conflict explanations, summaries, communication drafting

EHR Write-Back

- Appointments, provider messages, discharge documentation

Staff Interface

- Clear, actionable steps for nurses, pharmacists, and physicians

Build Timeline and Costs

Build Costs

- "Minimum Lovable Product (MLP) typically takes 2,000 - 2,500 hours for HIPAA compliant software"
- Assuming 2 engineers at $150,000 salary, this totals to **$350,000**

EHR Integration

- This cost is reliant on whether our product relies on Epic's free FHIR APIs.
- This cost could range anywhere from **$350,000 to $1,000,000** depending on custom integration or Epic's preexisting APIs

HIPAA Integration & Maintenance

- HIPAA integration usually relies on:
  - Privacy
  - Security
  - Enforcement
  - Breach Notification
- "We generally see the costs of developing a HIPAA compliant app increase by **$40,000 to $60,000**."
- Maintenance costs of **$4,000 to $6,000**

Build Timeline and Costs

Build Costs	$350,000	**$750,000 – $1,400,000**
EHR Integration	$350,000 to $1,000,000	
HIPAA Integration & Maintenance	$44,000 to $66,000	

Financial Feasibility

Total Addressable Market (TAM)
~$1.85 billion
37M discharges annually x $50/discharge

CRIT REFLECTIONS

Refining our Project Post-Crit

Comments we got:

Why our product?

Who's paying, who's benefiting,

who's using?

Elaborate on a story; Why should I care?

Prototyping

Visual Clarity & Acronyms

Token cost and financials

General Takeaways:

- We needed to show how our product mattered
- We needed to emphasize to the viewer that our product was viable, and that it would fill a gap
- We needed to connect our pitch to the viewer; Viewers won't always be in healthcare, so we should make them care

Refining our Project Post-Crit

Following the crit, our revisions focused on two main areas: visual clarity and accessibility. On the design side, we streamlined our slides to ensure everything on screen was purposeful — Peter's slide in particular had accumulated a lot of text, so he moved the detail into his script and kept the slides to the key ideas, letting the visuals support the presentation rather than replicate it. We also addressed how we handled specialized medical terminology. Several acronyms had gone undefined, which risked losing a non-clinical audience, so we made sure to clarify them throughout, which was a small change that meaningfully strengthened the overall pitch.

Repair of Inference Changes

Our primary inference repair strategy was "human-in-the-loop." We required human verification at every step (medicine, address, pharmacist) to minimize input errors. Additionally, a nurse provides final approval, checking all data and manually correcting any inaccuracies before submission.

FINAL PITCH SLIDES

The next 13 slides contain our final pitch.

Health Connect

Team 1

BrookeLynn Acevedo, Davis Germain, Alice Kang, Peter Shpelfogel, Ava Shu, Katie Weng

Hospital discharge is never easy.

Logistical hurdles are everywhere.

Inefficient Process: Scheduling transportation + waiting for paperwork

Highly manual: Nurses + case managers coordinating everything

Error-prone: Missed meds, delayed equipment, readmissions → $$$

Hospital discharge is never easy.

Logistical hurdles are everywhere.

Wastes time + money
when time + money
are *critical*.

Current Tools

INDIVIDUAL REFLECTIONS

Brooke’s Reflection

This project widely and rapidly expanded my ideas and knowledge of Agentic AIs. I feel like through this course, I have learned a lot about AI and various use cases but this one definitely pushed my: creativity, experiences, and comfort zones. I took the technology feasibility slides which gave me a deeper look into what makes Agentic AIs and how they can used in healthcare settings (particularly for communicative cases and easing tedious tasks for healthcare workers). I found it understanding detecting the steps the AI takes and how powerful it can be once properly designed. Afterward, I moved onto the business side which gave a whole new perspective to the point of our Agentic AI and project. I’m an Econ major so the numbers and market potential was exciting to explore. It was fun conducting market research to detect the market size, potential for growth, and ROI. Overall, while a challenging project, it forced me to think outside of the box and was arguably the most valuable project for my general experience(s) and knowledge gaining. I feel like I can explain and understand a lot more about Agentic AIs than I could’ve before this project.

Peter’s Reflection

For this project, we designed an agentic AI model to streamline hospital discharge. The concept card plotting exercise stood out as especially valuable — visually mapping each idea by risk and value made it straightforward to distinguish genuinely viable concepts from merely intriguing ones. Equally useful was the risk evaluation process, which went beyond identifying weaknesses to actively generating solutions for them. Once we selected our concept, I took ownership of the FATE analysis, which pushed me to think carefully about how the model would interact with the world and its users in practice. Working through Fairness, Accountability, Transparency, and Ethics in the context of a healthcare setting made the stakes feel real — patients and clinicians are vulnerable users, and the consequences of a poorly designed system extend well beyond a bad user experience. Thinking through potential points of failure, bias, and misuse forced me to consider not just what the model could do, but what it should do and under what conditions. This project helped me better understand how to translate an abstract AI concept into a responsible, human-centered design — and reinforced that the most important design decisions often have less to do with technical capability than with ethical judgment.

Alice’s Reflection

It was a bit hard for me to grasp what an Agentic AI was at the beginning of this project. I had trouble differentiating between Agentic and a regular LLM. However, through the construction of our project, whether through ideation or the demo, I developed an understanding of what Agentic AI is. It was interesting to see it applied as a B2B service, showcasing the usefulness of Agents as an operational systems rather than a consumer product. The impact it would have across companies rather than individual people showed the greater reach it had towards stakeholders. I especially enjoyed the challenge our team faced when choosing a theme that was riskier. It felt like the stakes were higher to create a more developed product. Overall, this was a very eye-opening project and fun to work with.

Davis' Reflection

I enjoyed this project and working with my team on it, because it introduced me to agents at a deeper level than what I had previously known. It continued to expand my knowledge of AI and its applications, all the while perfecting my pitch skills and learning the best ways to convey my ideas through slides. In previous projects I have done financial feasibility, but for this project I did technical feasibility. This was also a nice twist, because it helped me broaden my skills. I had to learn how to convey technical ideas to a non-technical audience, showing that it was a simple task but without getting too into the weeds and confusing viewers. This is a skill that I enjoyed honing and that I will continue to grow in future design/deliverable classes.

Katie’s Reflection

I really enjoyed this project because of the creative freedom we had with the idea we wanted to carry out. The risk-benefit analysis matrix was particularly helpful with this particular project because we decided to tackle an issue in the healthcare space that notoriously deals with sensitive information such as identifying individual information, health records, demographic data, etc. It was also interesting to think about how we would deal with privacy and other unintended consequences that came with building this platform. I built the technical prototype of Health Connect. I really enjoyed the process of figuring out the details of exactly what we wanted the platform to do, and how it could be integrated with pre-existing software like Epic electronic health records. Overall, this was probably my favorite project of this course since we were able to build a product we were really interested in that could potentially help a lot of people.

Ava’s Reflection

For this project, our team designed an agentic AI system to streamline hospital discharge, and one of the biggest takeaways for me was learning how to move from a broad idea to something more practical and grounded. The risk–value mapping and risk evaluation exercises were especially helpful in pushing us to think critically about feasibility, not just creativity. I also found the healthcare context impactful. It made me more aware of how important it is to consider privacy, bias, and reliability when designing systems that affect vulnerable users. This project reinforced that strong solutions aren’t just technically sound but they also need to be responsible and realistic in how they’re implemented. Overall, this experience helped me better understand agentic AI as not just a concept, but as something that needs to function within real-world constraints and human systems.

THANK YOU FOR A GREAT SEM!
